

FINDING ORDER IN CHAOS

A visual quiz on the mechanics of K-Means Clustering

1. What is the main purpose of K-Means Clustering?

A. To arrange data alphabetically

B. To divide similar data into groups

C. To delete incorrect data

D. To predict an exact answer

B. To divide similar data into groups

- A. To arrange data alphabetically
- C. To delete incorrect data
- D. To predict an exact answer
- D. To predict an exact answer

2. What does the letter K represent in K-Means?

A. The number of data points

B. The number of features

C. The number of groups or clusters

D. The number of computers used

C. The number of groups or clusters

3. What is a centroid in K-Means Clustering?

A. The center point of a cluster

B. The largest data point

C. The name of the dataset

D. A data point that is removed

A. The center point of a cluster

4. How does K-Means decide which cluster a data point belongs to?

A. It chooses a cluster randomly every time

B. It places the point in the nearest cluster center

C. It asks a person to choose

D. It places all points in one cluster

**B. It places the
point in the nearest
cluster center**

5. What happens during the K-Means process?

A. The centroids move until the clusters become stable

Step 1: Shift

Step 2: Redraw

Stable

The K-Means Lifecycle

From chaos to convergence, a single unified process.
